Day 16
(Help! Where is Santa?)

Tools used: Firefox, Terminal

We used nmap to find the port.

The port number for the web server is 80

The template that is being used is BULMA.
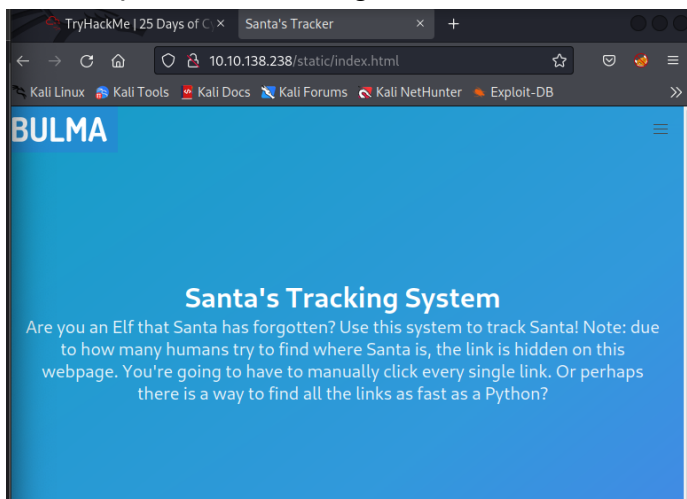

The directory for the API is */api*
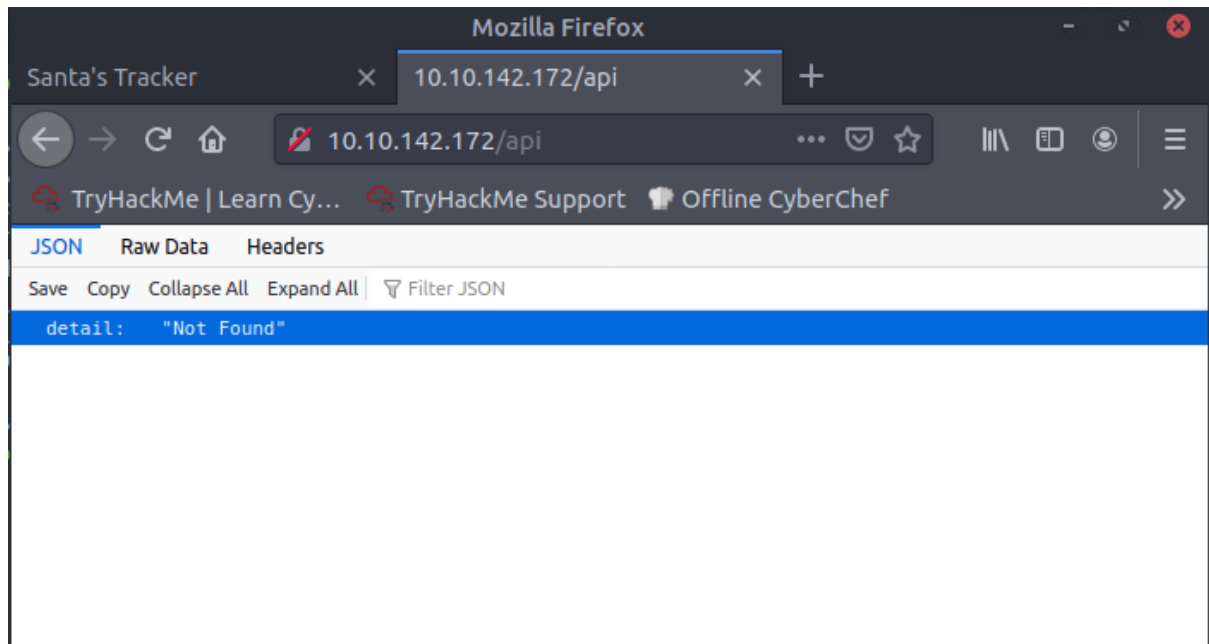

If no parameters are entered, it will return *{"detail":"Not Found"}*
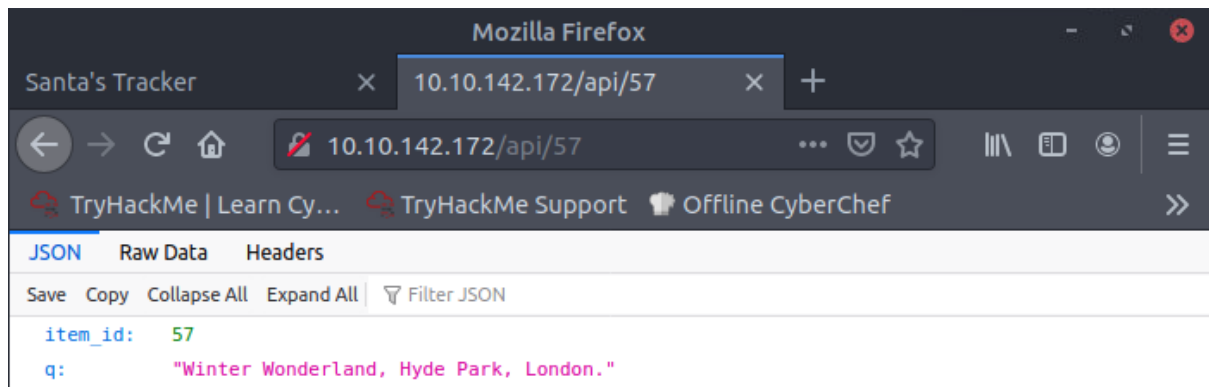

After figuring out the API key, we can now see Santa's location which is Winter Wonderland, Hyde Park, London.

After several attempts, the API key turned out to be 57.

Thought Process / Methodology:

After using nmap to find the port, head to the specified URL. On the top left of the website we can see the website template. To find the directory for the API, navigate to <Machine_IP>/api. We can now see how the website looks when there is no api key inserted on the URL. Finding the api key will take some amount of time of trial and error, but when the input for the api key is correct, the website will reveal Santa's location.

Tools used: Firefox, Terminal, Kali, Radare2
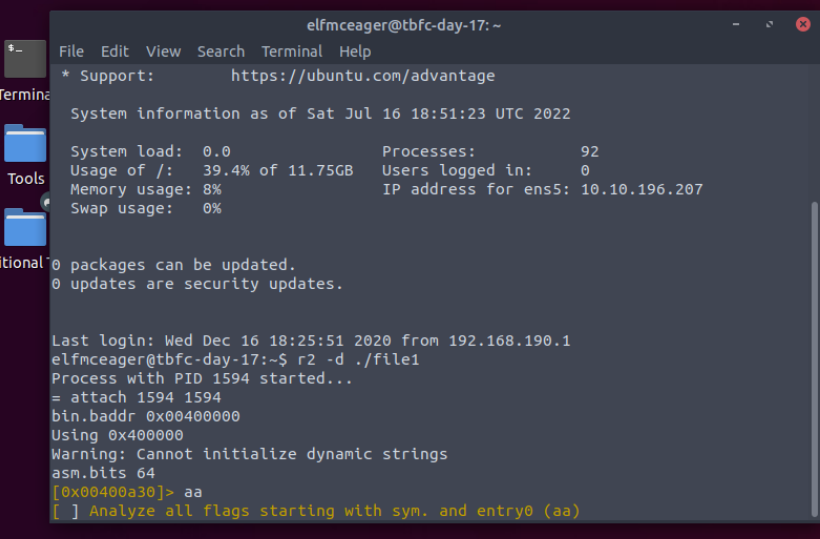

Question 1:

According to the information table below, we can figure out the data type and sizes :

Initial Data Type	Suffix	Size (bytes)
Byte	b	1
Word	w	2
Double Word	l	4
Quad	q	8
Single Precision	s	4
Double Precision	l	8

Question 2:

After connecting to radare2, we can analyse the program using the command : aa

```
                        elfmceager@tbfc-day-17: ~                       –  ⌐  ✕

 System information as of Sat Jul 16 18:51:23 UTC 2022

 System load:  0.0                Processes:           92
 Usage of /:   39.4% of 11.75GB   Users logged in:     0
 Memory usage: 8%                 IP address for ens5: 10.10.196.207
 Swap usage:   0%

 0 packages can be updated.
 0 updates are security updates.

 Last login: Wed Dec 16 18:25:51 2020 from 192.168.190.1
 elfmceager@tbfc-day-17:~$ r2 -d ./file1
 Process with PID 1594 started...
 = attach 1594 1594
 bin.baddr 0x00400000
 Using 0x400000
 Warning: Cannot initialize dynamic strings
 asm.bits 64
 [0x00400a30]> aa
 [ ] Analyze all flags starting with sym. and entry0 (aa)
```

We can use the command `db <address>` to set a breakpoint.

To confirm that breakpoint has been set, check the address and find the letter `b` next to it. We've successfully set a breakpoint.

After setting up the breakpoint, we can use the command `dc` to execute radare2 until it hits the breakpoint.

First, we need to use SSH to enter the target machine.

Next, we use the `ls` command to list all files found in the target directory. Here, we found challenge1 and file1.

```
Last login: Wed Dec 16 18:25:51 2020 from 192.168.190.1
elfmceager@tbfc-day-17:~$ ls
challenge1  file1
```

We can then proceed to use radare2 to debug the file.

```
elfmceager@tbfc-day-17:~$ r2 -d ./file1
Process with PID 1585 started ...
= attach 1585 1585
bin.baddr 0×00400000
Using 0×400000
Warning: Cannot initialize dynamic strings

[0×00400a30]>
```

After using the command `pdf @main` to get the main function, we can see local_ch. Use db to set up a breakpoint for local_ch, in this case it's `db 0x00400b51.`

```
[0×00400a30]> pdf @main
            ;-- main:
/ (fcn) sym.main 35
|   sym.main ();
|           ; var int local_ch @ rbp-0×c
|           ; var int local_8h @ rbp-0×8
|           ; var int local_4h @ rbp-0×4
|           ; DATA XREF from 0×00400a4d (entry0)
|           0×00400b4d      55             push rbp
|           0×00400b4e      4889e5         mov rbp, rsp
|           0×00400b51      c745f4010000.  mov dword [local_ch], 1
|           0×00400b58      c745f8060000.  mov dword [local_8h], 6
|           0×00400b5f      8b45f4         mov eax, dword [local_ch]
|           0×00400b62      0faf45f8       imul eax, dword [local_8h]
|           0×00400b66      8945fc         mov dword [local_4h], eax
|           0×00400b69      b800000000     mov eax, 0
|           0×00400b6e      5d             pop rbp
\           0×00400b6f      c3             ret
[0×00400a30]> db 0×00400b51
```

We can now use `dc` to execute until breakpoint is hit, then using `px @ rbp-0xc`, we can see the current memory value. Right now it is 0, but we can't confirm it until we run our ds command.

```

Thought Process/Methodology :

Reading through the radare2 guidelines and commands, I was struggling to understand the functions at first, it is harder than it looks. But the main commands which consisted of db, dc, ds, px and pdf are easier to understand. For the first question, we looked through the information table which reveals the data type and it's sizes. Question 2, 3 and 4 requires understanding of the command lines in a nutshell. For question 5, we started by going through the list of commands and using breakpoints to find out the value. We figured that by using dc and ds, we can eventually find the correct value of the source. Question 6 is a bit trickier, but by figuring out that the local_ch value has been moved to the eax register, we can simply use db and dr to check the value. Once executed, use dr again and we get the final answer. Finally, we set a breakpoint at the local_ch line and execute dc. We then checked the value by using px. This time around, we already used ds so 6 is our final answer.

Question 1:

We used Remmina provided in AttackBox to connect a remote access machine that has our TBFC app in, the message that shows up if you enter the wrong password for TBFC_APP is: *You're not Santa!*

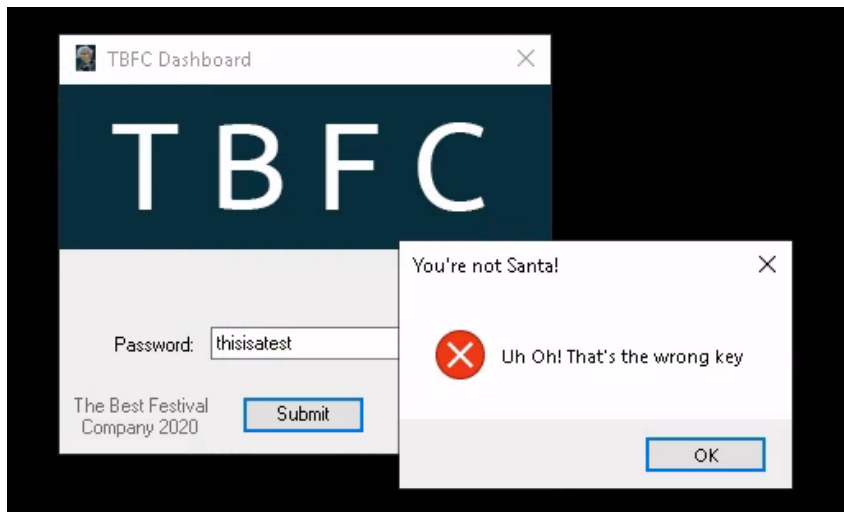

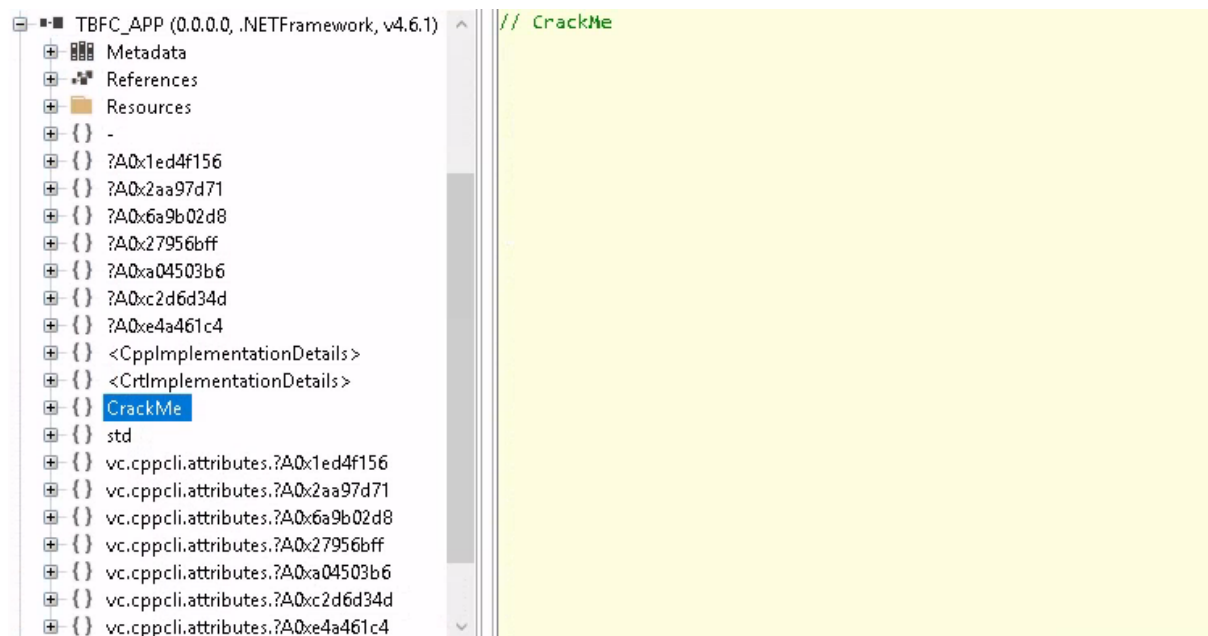

Question 2:

TBFC stands for: *The Best Festival Company*

Question 3:

The module that catches my attention is: *CrackMe*

Question 4:

The module that contains the information we are looking for is: *MainForm*

Question 5:

The method within the form that will contain the information we are seeking is:
buttonActivate_Click

What is Santa's password?: *santapassword321*

```
buttonActivate_Click(object, EventArgs) : void
```

```
    )

    ointer(ref <Module>.??_C@_0BB@IKKDFEPG@santapassword321@);
```

The flag is: *thm{046af}*

Thought Process/Methodology : We started off by connecting to the remote accessed machine through Remmina, and once connected with the IP address and credentials provided in the challenge, we were able to access the machine that included the TBFC file and ILSpy to use, opening the TBFC program lead us to login screen that have no other way of breaking in, so we used ILSpy to dissect the program as its written in dotNet. Upon further inspecting, we found a section named CrackMe and began finding its code, we soon found the appropriate credentials needed for this challenge.

Day 19
(The Naughty or Nice List)

Tools used: Kali, Firefox

To see whether the names are on the nice or naughty list, enter the name on the website's search bar.

Name:

Search

Timothy is on the Naughty List.

Timothy	Naughty
YP	Nice
Tib3rius	Nice
Kanes	Naughty
Ian Cha	Naughty
JJ	Naughty

When using /?proxy=http%3A%2F%2Flist.hohoho%3A8080%2F on the URL, it will display *'The requested URL was not found on this server'*.

Not Found

The requested URL was not found on this server.

When using /?proxy=http%3A%2F%2Flist.hohoho%3A80 on the URL, it will display *'Failed to connect to list.hohoho port 80: Connection refused'*.

Failed to connect to list.hohoho port 80: Connection refused

When using /?proxy=http%3A%2F%2Flist.hohoho%3A22 on the URL, it will display *'Recv failure: Connection reset by peer'*.

Recv failure: Connection reset by peer

When using /?proxy=http%3A%2F%2Flocalhost on the URL, it will display *'Your search has been blocked by our security team'*.

Your search has been blocked by our security team.

Santa's password can be obtained by using
?proxy=http%3A%2F%2Flist.hohoho.localtest.me on the URL.
Santa,

If you need to make any changes to the
Naughty or Nice list, you need to login.

I know you have trouble remembering your
password so here it is: Be good for
goodness sake!

– Elf McSkidy

Scroll down and login using the given password. The username is Santa. On this new page, click 'DELETE NAUGHTY LIST' and the flag will be revealed.

Thought Process/Methodology :

After navigating to the website, the search bar is to see whether someone is on the naughty or the nice list. Now let's play with the URL a bit. Fetching the root of the same site will display the URL not found message. Now change the port to 80. It's now failed to connect. Using another port (22) will display a Recv failure. Lastly, change 'list.hohoho' on the URL to 'localhost' and the search is now blocked. To obtain the password, use 'list.hohoho.localtest.me' as the hostname to bypass the check. Scroll down until the login panel is visible. The username can be easily guessed. Log in and it will redirect to a new page. Click the DELETE NAUGHTY LIST button and the flag will show up.

Day 20
(PowershELIF to the rescue?)

Tools used: Firefox, Terminal, Kali, Google

The -l command is used to specify the *login name*.
(Via https://explainshell.com/explain?cmd=ssh+-L+-N+-f+-l)

```
-l login_name
        Specifies the user to log in as on the remote machine.  This also may be specified on a per-host
        basis in the configuration file.
```
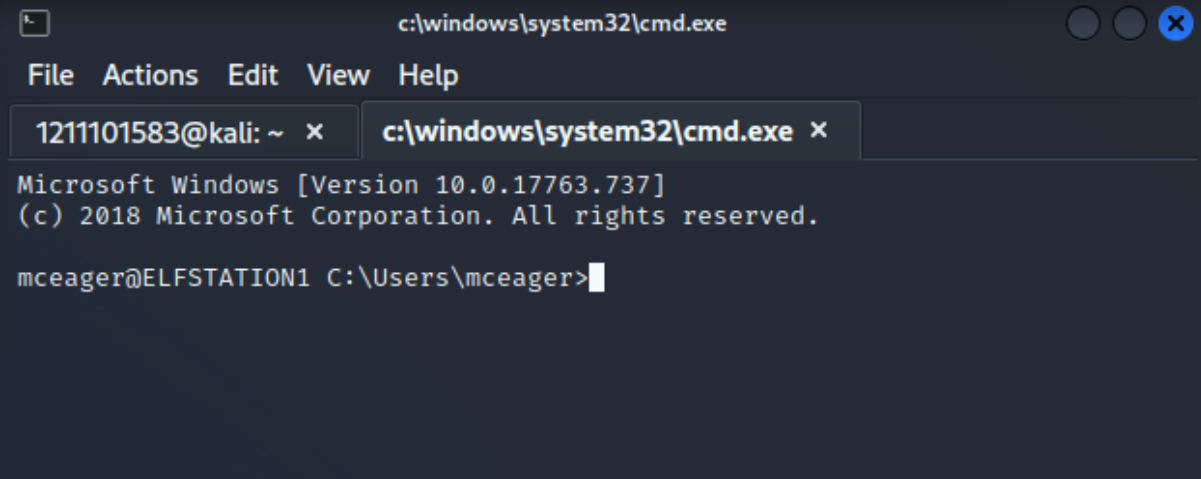

We start by connecting to the remote machine by doing the following command;

ssh -l mceager <Machine_IP>

When prompted for password, type in *r0ckStar!*
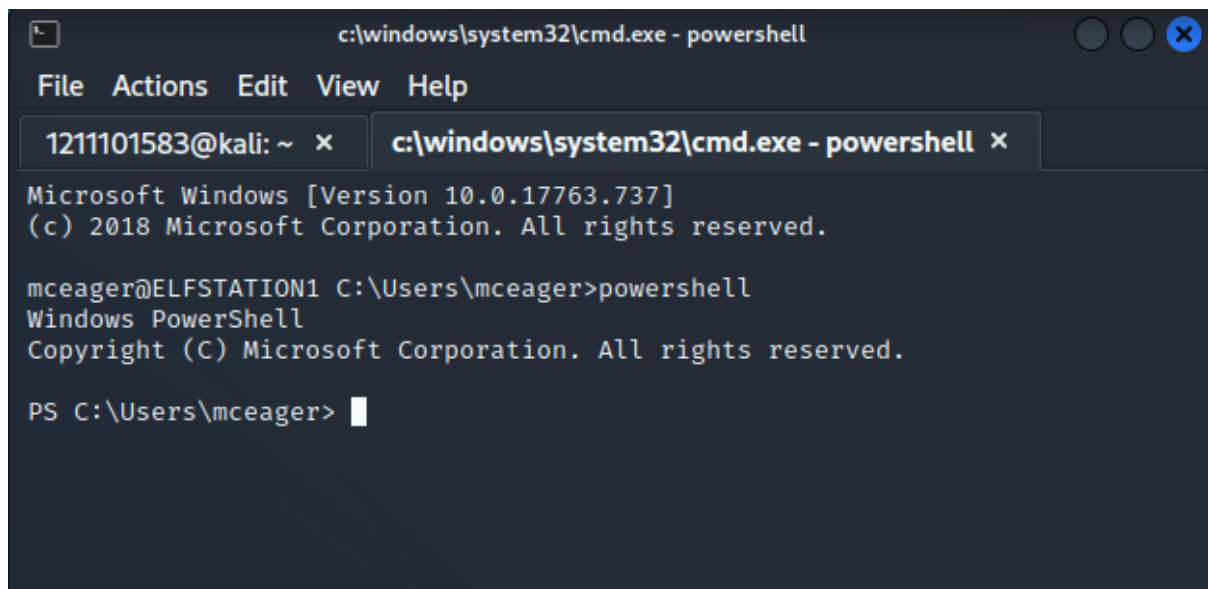

This window will appear when the login is successful

Type in *powershell*

Use Get-ChildrenItem -File- -Hidden to see the hidden files. As we can see, there's a hidden file called e1fone.txt. Then, use cat e1fone.txt to read the content of the file.

In the desktop directory, use ls -Hidden to see the hidden files. There's a file called elf2wo. Inside the file, there's a .txt file. Use the cat command to read the content of the file.

```
PS C:\Users\mceager\Desktop> ls -Hidden

    Directory: C:\Users\mceager\Desktop

Mode                 LastWriteTime         Length Name
----                 -------------         ------ ----
d--h--         12/7/2020   11:26 AM                elf2wo
-a-hs-         12/7/2020   10:29 AM            282 desktop.ini

PS C:\Users\mceager\Desktop> cat elf2wo
cat : Access to the path 'C:\Users\mceager\Desktop\elf2wo' is denied.
At line:1 char:1
+ cat elf2wo
+ ~~~~~~~~~~
    + CategoryInfo          : PermissionDenied: (C:\Users\mceager\Deskto
   p\elf2wo:String) [Get-Content], UnauthorizedAccessException
    + FullyQualifiedErrorId : GetContentReaderUnauthorizedAccessError,Mi
   crosoft.PowerShell.Commands.GetContentCommand

PS C:\Users\mceager\Desktop> cd elf2wo
PS C:\Users\mceager\Desktop\elf2wo> ls

    Directory: C:\Users\mceager\Desktop\elf2wo

Mode                 LastWriteTime         Length Name
----                 -------------         ------ ----
-a----        11/17/2020   10:26 AM             64 e70smsW10Y4k.txt

PS C:\Users\mceager\Desktop\elf2wo> cat e70smsW10Y4k.txt
I want the movie Scrooged <3!
PS C:\Users\mceager\Desktop\elf2wo> █
```

To find the files for elf 3, use *Get-ChildItem -Hidden -Directory -Filter "*3*"* to find the File and its location.

```
PS C:\Windows\System32> Get-ChildItem -Hidden -Directory -Filter "*3*"

    Directory: C:\Windows\System32

Mode                 LastWriteTime         Length Name
----                 -------------         ------ ----
d--h--         11/23/2020     3:26 PM             3lfthr3e
```

In the file that we just discovered, use *Get-ChildItem -Hidden* to reveal the two .txt files.

```
PS C:\Windows\System32> cd 3lfthr3e
PS C:\Windows\System32\3lfthr3e> ls
PS C:\Windows\System32\3lfthr3e> Get-ChildItem -Hidden

    Directory: C:\Windows\System32\3lfthr3e

Mode                 LastWriteTime         Length Name
----                 -------------         ------ ----
-arh--         11/17/2020    10:58 AM          85887 1.txt
-arh--         11/23/2020     3:26 PM       12061168 2.txt
```

Then, use Get-Content 1.txt | Measure-Object -Word to find out the amount of words in the file.

```
PS C:\Windows\System32\3lfthr3e> Get-Content 1.txt | Measure-Object -Word

Lines Words Characters Property
----- ----- ---------- --------
       9999
```

Use *(Get-Content 1.txt)[551]* and *(Get-Content 1.txt)[6991]* to find out the word on the specified location in the file.

```
PS C:\Windows\System32\3lfthr3e> (Get-Content 1.txt)[551]
Red
PS C:\Windows\System32\3lfthr3e> (Get-Content 1.txt)[6991]
Ryder
```

To find out what elf3 wants, use *Get-Content 2.txt | Select-String -Pattern "redryder"*

```
PS C:\Windows\System32\3lfthr3e> Get-Content 2.txt | Select-String -Patter
n "redryder"

redryderbbgun
```

Thought Process / Methodology:

The use for the command -l can be found easily with a quick Google search. Then, log in to the remote machine using the provided username and password. After successfully logged in, navigate to the Documents directory and search for hidden files. Read the text file to expose the content. The next file can be found in Desktop. Inside the hidden file there is a .txt file in which you can read the content of the file to find the movie name. The next file requires some extra steps. Start by searching for the file's name and its location. Navigate to the file that was just discovered. Inside, there's two .txt files to be explored. For the first file, use the command that will show the amount of words in the file. For the next one, the location of the word needs to be specified in the command in order for it to reveal the two words. By combining the two words from the last question, we can easily know what elf3 wants.
